Abstract of FR 2739151 (A1)

The fixing (2) is formed as a threaded rod with a constant pitch to retain an implant (1) with a threaded opening (3) traversed by the rod which is screwed into the support material (s). The frame (6) is shaped to exert, in the threaded opening, a radial compression to immobilise the rod in the implant and to ensure relative positioning. The threaded rods can have, over a length (D) equal to at least one pitch, a core with a radius traversing the end of the thread.
